ABOUT AMERICAN CARBON REGISTRY® (ACR)

A leading carbon offset program founded in 1996 as the first private voluntary GHG registry in the world, ACR operates in the voluntary and regulated carbon markets. ACR has unparalleled experience in the development of environmentally rigorous, science-based offset methodologies as well as operational experience in the oversight of offset project verification, registration, offset issuance and retirement reporting through its online registry system.

ABOUT THIS MANUAL

This is a user's manual for project developers, project participants and those otherwise interested in the conduct of the **Avoided Conversion of Grasslands and Shrublands to Crop Production** carbon offset project type with the American Carbon Registry. It is based on v.2.0 of the methodology (October 2019) and the accompanying Errata and Clarification (March 2020).

Documents referenced within:

- [Methodology for the Quantification, Monitoring, Reporting and Verification of Greenhouse Gas Emissions Reductions and Removals from Avoided Conversion of Grasslands and Shrublands to Crop Production v.2.0](#) (“the Methodology”)
- [The American Carbon Registry Standard – Latest version](#)
- [The American Carbon Registry Validation and Verification Standard – Latest version](#)
- Project Planning Tool (Excel, available from ACR upon request)
- [Risk Tool and Buffer Pool Contributions](#)

This document supports and simplifies information in the methodology but **does not replace requirements listed in the methodology or the ACR Standard**. Corresponding sections of the methodology are listed. This document is intended to facilitate and catalyze the early stages of project planning especially for developers new to the project type.

Definitions of terms used in this document can be found in the Methodology (**Methodology, Section 8**) and in the ACR Standard. An abridged list of acronyms is included below for easy reference.

USER'S MANUAL

FOR CARBON OFFSET PROJECTS FROM THE AVOIDED CONVERSION
OF GRASSLANDS AND SHRUBLANDS TO CROP PRODUCTION

ACR	American Carbon Registry
COI	Conflict of Interest
ERTS	Emissions Reductions Tonnes
GHG	Greenhouse Gas
LCA	Land Conservation Agreement
LCC	Land Capability Class
MRV	Monitoring, Reporting and Verification
PDA	Programmatic Development Approach
SOC	Soil Organic Carbon
SSR	Sources, Sinks and Reservoirs
VVB	Validation and Verification Body

PROJECT DEFINITION AND ELIGIBILITY

PROJECT ACTIVITY

The recording of a conservation easement (land conservation agreement, LCA) on a property that includes land parcels of grassland or shrubland that would otherwise be converted for agriculture. (**Methodology, Section 1.1**)

The methodology estimates the GHG emissions avoided by preventing the conversion of grasslands and shrublands to annual crop production. The greatest net GHG benefit from the project activity is anticipated to be the avoided release of soil organic carbon (SOC). This methodology conservatively assumes that avoided conversion results in the maintenance (without increase) of carbon stocks in the pools of soil organic carbon, and above-ground and below-ground biomass remain at steady state throughout the project scenario.

PROJECT ELIGIBILITY

In addition to meeting all requirements in the latest version of the ACR Standard, each field in the project must meet the criteria below. (**Methodology, Section 1.2**)

Table 1: Eligibility Criteria

CRITERIA	CHECK (✓) IF YES
1. All fields to be enrolled avoid the complete conversion to annual Cropland. Avoided conversion to land uses other than Cropland (e.g. development) is not an allowed activity.	<input type="checkbox"/>
2. All fields to be enrolled in the GHG project are in the United States.	
3. All fields to be enrolled in the GHG project are currently grassland or shrubland; fields have been grassland or shrubland ¹ for at least 10 years; cropland is the most likely next land use for the fields.	<input type="checkbox"/>
4. No legal prohibition exists to prevent conversion to cropland of all fields to be enrolled in the GHG project.	<input type="checkbox"/>
5. All fields to be enrolled in the GHG project are covered by a qualified Land Conservation Agreement (LCA), e.g. a conservation easement for 40 years (minimum project term).	<input type="checkbox"/>
6. The LCA includes a “sodbuster clause”, explicitly prohibiting grassland conversion to another land use	<input type="checkbox"/>
7. The LCA is recorded on the deed for the property	<input type="checkbox"/>
8. Fields are located entirely within counties shown and listed in Figure 3 and Table 3 of Appendix B (this User’s Manual) and Figure 2 and Appendix B of the Methodology (Methodology, Section 3.1.1.2 and Appendix B) for unidentified agents of conversion OR written offers to buy or lease the fields specify cropland as highest and best use and reference water rights and infrastructure for irrigation (if required) (Methodology, Section 3.1.1.2) for identified agents.	<input type="checkbox"/>
9. At least 50% of the GHG project area is in Land Capability Class (LCC) I-IV and no more than 25% is in Land Capability Class VII and VIII, according to the SSURGO non-irrigated lands database ² .	<input type="checkbox"/>
10. Landowner holds title to carbon and submits to ACR an Statement of Intent to conduct a carbon project in conjunction with the LCA; Statement of Intent is submitted to ACR within ±12 months of the LCA recording date.	<input type="checkbox"/>

¹ As defined in the American Carbon Registry Standard (<https://americancarbonregistry.org/carbon-accounting/standards-methodologies/american-carbon-registry-standard>)

² <https://websoilsurvey.sc.egov.usda.gov/App/HomePage.htm>

USER'S MANUAL

FOR CARBON OFFSET PROJECTS FROM THE AVOIDED CONVERSION
OF GRASSLANDS AND SHRUBLANDS TO CROP PRODUCTION

CRITERIA	CHECK (✓) IF YES
11. Project developer holds title to carbon rights and submits to ACR a copy of the agreement transferring carbon rights ownership from the landowner to the project developer; Agreement is dated and submitted to ACR within ±12 months of the LCA recording date.	<input type="checkbox"/>
12. No fields to be enrolled in the GHG project include organic soils, peatlands, or wetlands and these areas are present, they have been excluded from the project per the Methodology, Section 2.1.2 .	<input type="checkbox"/>
13. Justification for an irrigated cropland scenario is provided (where needed) and includes demonstration of water access, legal and physical, and discussion of irrigation practices on neighboring or similar properties within the county.	<input type="checkbox"/>
14. IF livestock are present in the project scenario, manure is not managed, stored or dispersed in liquid form.	<input type="checkbox"/>
15. IF livestock are present in the project scenario, they are primarily forage fed and not confined.	<input type="checkbox"/>

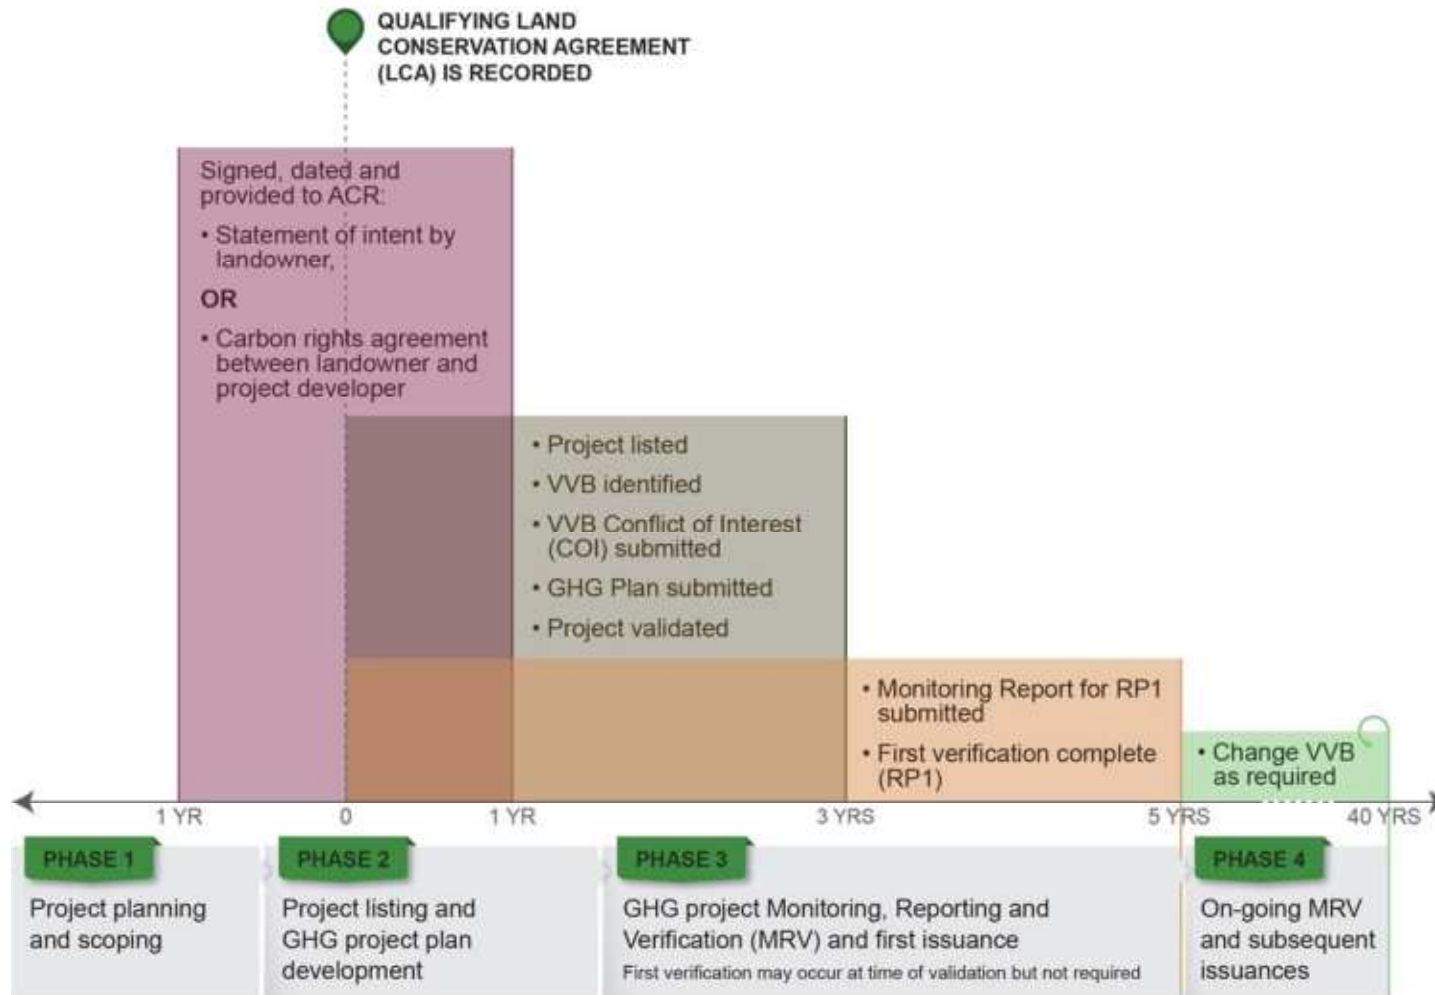

TIMELINE

The basic project timeline for a single property or aggregated project is shown below. The **recording of a conservation easement** is the defining action in the project timeline. Critical project milestones are shown in relation to this date.

- Phase 1 – Project planning and scoping
- Phase 2 – Project listing and GHG project plan development
- Phase 3 – GHG project Monitoring, Reporting and Verification (MRV) and first issuance
- Phase 4 – On-going MRV and subsequent issuances

The key **activities, questions to be answered** and important **documents to be gathered and/or submitted** are listed below for each Phase. The scenario below assumes that the DAYCENT model is used for quantification of the soil organic carbon (SOC) pool, although other methods are allowed as shown in Table 2 (this User's Manual).

Figure 1: Project Timeline

Notes: The exact timing for the beginning of phases 1, 2 and 3 can vary. Validation and Verification for RP1 may (but not required to) occur simultaneously for RP1, i.e. Phase 2 and 3 may fully overlap. Steps in Phase 2 are only required once per crediting period.

PHASE 1: PROJECT PLANNING AND SCOPING

PHASE 1 ACTIONS

- Assess the feasibility of the project
- Understand the project timeline and deadlines
- Review the ACR Standard and the project specific eligibility criteria
- Establish an ACR account
- Connect with a DAYCENT modeling practitioner (if using DAYCENT for SOC pool)
- Engagement with landowners, conservation easement stakeholders, buyers

PHASE 1 PROJECT TRAJECTORY CHECKS

- What properties will be included and what are the dates of easement recording for each (**Methodology, Section 2.3** and if PDA, **ACR Standard, Chapter 6F**)?
- Based on the easement date, what are the dates of other key milestones (**Methodology, Section 8** and **ACR Standard, Chapter 3**)?
- What are the monitoring requirements under the easement (**Methodology, Section 8**)?
- Do all properties meet all eligibility criteria in the methodology (**Methodology, Section 1.2**)?
- Is the project in compliance with the ACR Standard?
- Who will hold title to the carbon offsets (**Methodology, Section 1.2**)?
- Is the project property (ies) located in counties listed in Appendix B of the methodology (**Methodology, Section 3.1.1**)?

- If no, is there evidence to support an unidentified agent of conversion (**Methodology, Section 3.1.1**)?
- What is the baseline cropland management scenario (**Methodology, Section 3.1.2**)?
- Will the project include any optional pools (**Methodology, Section 2.2**)?
- Will DAYCENT be used to quantify the soil carbon pool (**Methodology, Sections 6.1.3 and 6.2.3**)? If no, see Table 2 below (this User's Manual) for quantification options by pool.
- Who will set up the DAYCENT model for the project? What data do they need and what are their costs (**Methodology, Sections 5 and 6**)?
- What are the soil types in the project area (**Methodology, Sections 6.1.3 and 6.2.3**)?
- Does grazing occur in the baseline scenario, project scenario or both (**Methodology, Section 6.1.5 and 6.2.5**)?
- What are the estimated VVB costs, Registry fees, other costs and the timing of costs?
- What is the estimated Risk Deduction and estimated contribution to the buffer pool (**Methodology, Section 6.6.3**)?

PHASE 1 DOCUMENTS/FILES/DATA

- Shape files of the LCA boundary, GHG boundary that excludes roads, buildings, wetlands etc. (**Methodology, Section 2.1**)?
- Datasets defining the baseline scenario (**Methodology, Section 3.1.2**)?
- ACR Avoided Conversions of Grasslands and Shrublands Planning Tool (request acr@winrock.org)
- Listing form

PHASE 2: PROJECT LISTING AND GHG PROJECT PLAN DEVELOPMENT

PHASE 2 ACTIONS

- Create the GHG Plan and Ex-Ante Offset Projection ([templates](#) available)
- ACR completes review of the GHG Plan and project is listed
- Record the easement and begin monitoring requirements under the easement
- Engage a Validation and Verification Body (VVB)
- Submit COI for VVB
- Submit Statement of Intent or carbon rights agreement between landowner and project developer

PHASE 2 PROJECT TRAJECTORY CHECKS

- What is the last date that a Statement of Intent or Carbon Rights agreement can be submitted?
- What is the date by which the project must be validated?
- Are values available for all parameters available at validation (Table A.2)?
- Will validation be conducted simultaneously with the first verification? (if yes, see Phase 3)
- Does the verifier require a site visit (**Methodology, Section 8**)?
- Does the project require stratification (**Methodology, Section 4**)?

PHASE 2 DOCUMENTS/FILES/DATA

- Statement of Intent or Carbon Rights Agreement
- VVB COI
- GHG Project Plan (including supporting data files; submitted once per Crediting Period and upon first verification)
- GHG Ex-Ante Offset Projection
- Recorded Easement
- Phase 3 documents – IFverification for Reporting Period 1 will occur together with validation

PHASE 3: GHG PROJECT MRV AND FIRST ISSUANCE

PHASE 3 ACTIONS

- Complete DAYCENT modeling for the SOC pool³ on project parcels for the first 5 years of the project. Baseline management scenario must be updated at 5-year intervals where needed. Contact ACR for specific DAYCENT modeling guidance.
- Complete quantification of ERTs for project parcels for each year in the reporting period (Figure 2, this User's Manual)
- Complete Verification (and Validation if not already conducted). Validation must be within 36 months of project start date (easement recording) and verification (if separate from validation) must be completed within 60 months of project start date (easement recording).
- Credits are issued by ACR and can be transacted

PHASE 3 PROJECT TRAJECTORY CHECKS

- How many years are included in the first reporting period?
- Have there been any easement violations during the reporting period?
- Has the deadline to complete verification 1 before end of year 5 been met?
- Have all necessary documents been submitted to ACR and retained by VVB and Project Developer?

³ DAYCENT is one of several allowed quantification approaches for several pools (see Table 2). This Manual describes the scenario where optional pools are excluded and DAYCENT is used to quantify the SOC pool.

- Are there any changes to the GHG Project Plan or lessons learned that need to be incorporated for verification 2?
- Has a buyer been identified for the first issuance of ERTs?

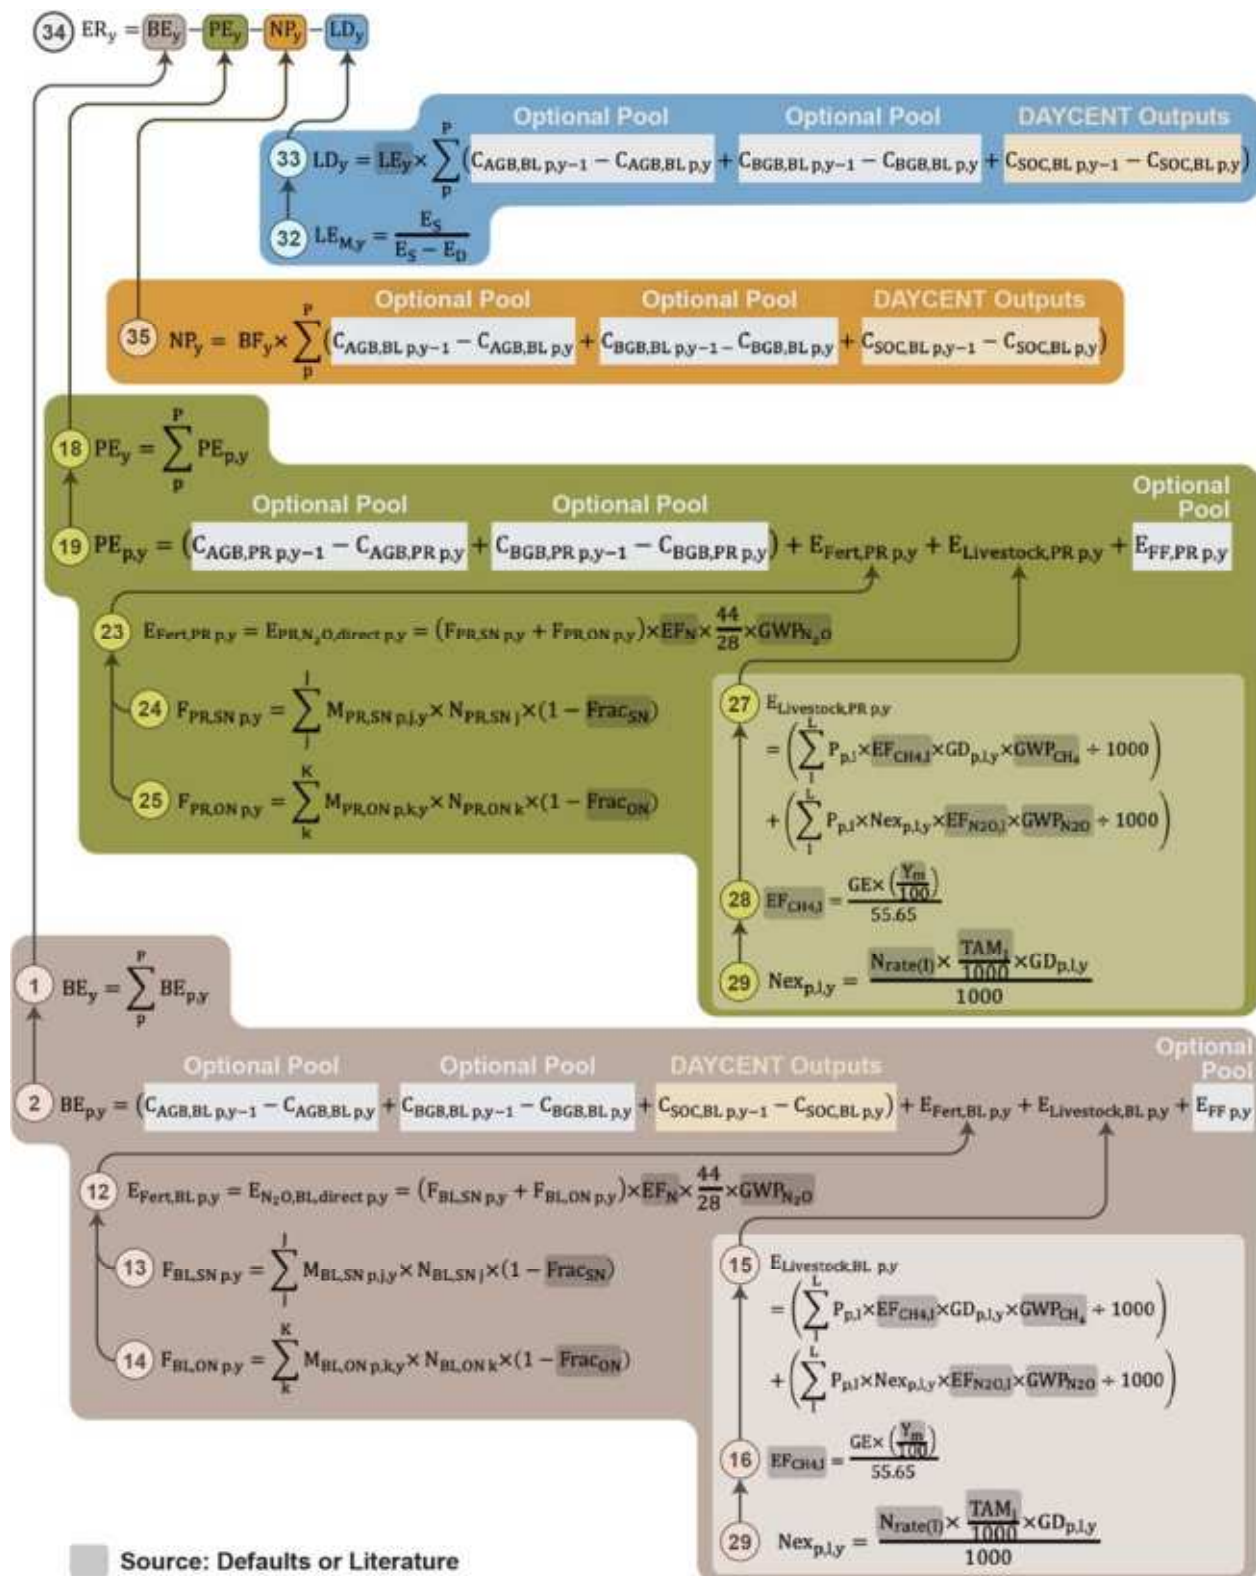

PHASE 3 DOCUMENTS/FILES/DATA

- GHG Monitoring Report for Reporting Period 1 and supporting documentation
- Validation Report (once per Crediting Period)
- Validation Statement
- Verification Report for Reporting Period 1
- Verification Statement for Reporting Period 1

Figure 2 on the following page maps all equations (for non-optional pools) listed in **Section 6** of the **Methodology**. Figure 2 starts with equation 34 which ultimately calculates annual ERTs from the sum of the GHG emissions/reductions in the Baseline (BE_y) and Project (PR_y) scenarios, and from Leakage (LE_y) and Non-Permanence (NP_y). Circled numbers (Ⓢ) correspond to equation numbers in **Section 6** of the **Methodology**. All terms are defined in Appendix A of the Methodology and included here for easy reference (Appendix A, this User's Manual)⁴. Figure 2 assumes that the DAYCENT model is used to quantify SOC (other approaches are allowed per the **Methodology**, **Sections 6.1.3** and **6.2.3**) and non-optional pools are excluded. Gray squares highlight where default values are available/allowed.

⁴ Please note that Appendix A of this User's Manual reflects changes described in the Errata and Clarifications issued in March 2020 and shown in the accompanying redline of v.2.0 of the methodology.

Figure 2: Equation Map

PHASE 4: ON-GOING MRV AND SUBSEQUENT ISSUANCES

PHASE 4 ACTIONS

- After year 5, update DAYCENT model to reflect any changes to the baseline cropland management scenario and update evidence substantiating the scenario
- Ensure that annual easement monitoring is being conducted and collect reports
- Report reversals or massive events such as fires, droughts or floods or change in ownership
- Submit for verification at least once every 5 years
- Change VVBs at least once every 5 years or 5 verifications; re-submit COI

PHASE 4 PROJECT TRAJECTORY CHECKS

- How frequently will the project be verified?
- Does verification need to be coordinated with other projects?
- Is easement monitoring occurring as prescribed?
- When will ERTs be transacted and what are the costs?
- Has the sale of ERTs in issuances 2,3,4...n been contracted?

PHASE 4 DOCUMENTS/FILES/DATA

- GHG Monitoring Report for Reporting Period 2,3,4 n and supporting documentation

USER'S MANUAL

FOR CARBON OFFSET PROJECTS FROM THE AVOIDED CONVERSION
OF GRASSLANDS AND SHRUBLANDS TO CROP PRODUCTION

- Verification Report for Reporting Period 2,3,4 n
- Verification Statement for Reporting Period 2,3,4 n
- Annual Easement monitoring reports
- Data substantiating the hypothetical baseline scenario for the current 5-year period
- VVB COI

OTHER INFORMATION

AGGREGATION AND PROGRAMMATIC DEVELOPMENT APPROACH (PDA) PROJECTS

To achieve scale and consequent economic viability, carbon offset projects of this type will often necessarily be composed of numerous properties under their own LCAs, grouped into a single project with ACR. ACR allows for multiple fields, facilities or parcels (sites) to be grouped into single projects via two approaches: 1) Aggregation and 2) Programmatic Development Approach (PDA). Aggregated projects shall include ALL sites in the initial GHG Project Plan. No new sites can be added after validation. The PDA allows for a “rolling enrollment” style system where additional sites can be added over time, with some restrictions. Specific requirements for Aggregated and PDA projects are listed in Chapter 6 of the ACR Standard.

USE OF THE DAYCENT MODEL

The DAYCENT model is one of several available options for quantification of the AGB, BGB and SOC pools (**Methodology, Sections 6.1.1, 6.1.2, 6.1.3 and 6.2.1, 6.2.2, 6.2.3,**). DAYCENT is the daily time-step version of the CENTURY biogeochemical model (Parton et al., 1994). DAYCENT simulates fluxes of C and N among the atmosphere, vegetation, and soil (Del Grosso et al., 2001a; Parton et al., 1998). Model inputs are: daily maximum/minimum air temperature and precipitation; surface soil texture class; and land cover/use data (e.g., vegetation type, cultivation/planting schedules, amount and timing of nutrient amendments).

Model outputs include: daily N-gas flux (N₂O, NO_x, N₂); CO₂ flux from heterotrophic soil respiration; soil organic C and N; NPP; H₂O and NO₃ leaching; and other ecosystem parameters. The ability of DAYCENT to simulate NPP, soil organic carbon, N₂O emissions, and NO₃ leaching has been tested with data from various native and managed systems (Del Grosso

USER'S MANUAL

FOR CARBON OFFSET PROJECTS FROM THE AVOIDED CONVERSION
OF GRASSLANDS AND SHRUBLANDS TO CROP PRODUCTION

et al., 2001b; 2002; 2005).⁵ DAYCENT model experts are available for hire for a fee. ACR can connect interested project developers with a DAYCENT modeling expert. Post-processing instructions for DAYCENT model outputs are available from ACR for registered projects.

⁵ <https://www2.nrel.colostate.edu/projects/daycent/>

APPENDIX A: PARAMETERS

A.1 PARAMETERS DEFINED BY METHODOLOGY EQUATIONS

All parameters in A.1 can also be obtained as outputs from approved biogeochemical models.

PARAMETER	UNIT	DESCRIPTION	SOURCE	USED IN EQ.
BE_y	MTCO ₂ e	Baseline emissions in year y , all field. $y=0$ at project start date		1
$BE_{p,y}$	MTCO ₂ e	Baseline emissions from participant field p , in year y		1,2
$C_{AGB,BL,p,y}$	MTCO ₂ e	Carbon stock of above-ground biomass for Participant Field p in the baseline scenario in year y		2,3
$C_{AGB,b,y=0}$	MTCO ₂ e	Initial (year $y=0$) carbon stock of above-ground biomass for biomass type b		20, 21, 22
$C_{AGB,PR,p,y}$	MTCO ₂ e	Carbon stock of above-ground biomass for Participant Field p in the project scenario in year y		4, 19, 20

PARAMETER	UNIT	DESCRIPTION	SOURCE	USED IN EQ.
$F_{BL/PR,ON,p,y}$	MT-N	Mass of organic N amendments applied to Participant Field p in the baseline/project scenario in year y adjusted for volatilization as NH_3 and NO_x		12, 14, 23, 25
$F_{BL/PR,SN,p,y}$	MT-N	Mass of synthetic fertilizer nitrogen applied to Participant Field p in the baseline/project scenario in year y adjusted for volatilization as NH_3 and NO_x		12, 13, 23, 24
$E_{Fert,BL/PR,p,y} = E_{BL/PR,N_2O,direct,p,y}$	MTCO _{2e}	Total N_2O emissions due to application of synthetic and organic fertilizer from Participant Field p in the baseline/project scenario in year y .		2, 12, 19, 23
$E_{(BL/PR),FF,p,y}$	MTCO _{2e}	Emissions due to the use of fossil fuels in agricultural management in the baseline/project scenario on Participant Field p in year y		2, 17, 19, 30
$EF_{t,y}$	d.u.	Emission factor for the fraction of soil organic carbon pool remaining t years since conversion to Cropland in year y		10, 11
$Nex_{l,p,y}$	kg N (animal) ⁻¹ (yr.) ⁻¹	Annual average N excretion per head of livestock type l , Participant Field p in year y		15, 27, 29

PARAMETER	UNIT	DESCRIPTION	SOURCE	USED IN EQ.
$E_{\text{Livestock,BL/PR}_{p,y}}$	MTCO _{2e}	CH ₄ emission from livestock enteric fermentation and N ₂ O emissions from deposited, un-managed livestock waste on Participant Field p in year y		2, 15, 19, 27
PE_y	MTCO _{2e}	Total project emissions in year y		18
$PE_{p,y}$	MTCO _{2e}	Total project emissions from participant field p in year y		18, 19
LE_y	(0.0 -0.1)	Leakage factor in year y		31
LD_y	MTCO _{2e}	Leakage deduction in year y		33

A.2 PARAMETERS AVAILABLE AT VALIDATION

PARAMETER	UNIT	DESCRIPTION	SOURCE	USED IN EQ.
A_b	ha	Area of biomass/crop type b	Project Proponent	6, 21
$A_{p,i}$	ha	Area of Participant Field in soil strata i	Project Proponent	10

USER'S MANUAL

FOR CARBON OFFSET PROJECTS FROM THE AVOIDED CONVERSION OF GRASSLANDS AND SHRUBLANDS TO CROP PRODUCTION

PARAMETER	UNIT	DESCRIPTION	SOURCE	USED IN EQ.
$C_{AGB_b, y=0}$	MTCO ₂ e	Initial (year $y=0$) carbon stock of aboveground biomass for Participant Field p	Approved models, direct measurements, remote sensing, data published in scientific literature	20, 21, 22
$C_{SOC_i, y=0}$	MTCO ₂ e (ha) ⁻¹	Total initial (year $y=0$) soil organic carbon stock in soil strata i , fixed for project duration	Approved models, direct measurements, data published in scientific literature. Default values from IPCC 2006 AFOLU GL, Table 2.3.	10
CF_b	MT C (MT dry matter) ⁻¹	Carbon fraction of dry matter for biomass type b	Data published in scientific literature Default values from IPCC 2006 AFOLU GL, Table 11.2.	6, 21
D	years	Transition period for soil organic carbon, time period for transition between equilibrium SOC values, default value of 20	Approved models, direct measurements, data published in scientific literature. Default value of 20 years (IPCC 2006 AFOLU GL, Ch. 2.3.2.2).	11
$DM_{b, y=0}$	MT/ha	Average, annual, dry matter for biomass type b at project initiation (year $y=0$)	Approved models, direct measurements, published data.	21
$e^{(-0.77 \times (y-t))}$	d.u.	The decay function for aboveground biomass following conversion	Kochsiek et al. 2009	4

USER'S MANUAL

FOR CARBON OFFSET PROJECTS FROM THE AVOIDED CONVERSION OF GRASSLANDS AND SHRUBLANDS TO CROP PRODUCTION

PARAMETER	UNIT	DESCRIPTION	SOURCE	USED IN EQ.
$e^{(-1.41 \times (y-t))}$	d.u.	The decay function for below-ground biomass following conversion	Silver and Miya 2001	8
EF_f	MTCO ₂ e (liter of fuel) ⁻¹	Emission factor for the type of fossil fuel combusted in vehicle or equipment	For gasoline EF CO ₂ e = 8.89 kg CO ₂ e/gallon. For diesel EF CO ₂ e = 10.16 kg CO ₂ e/gallon. Source: EIA ⁶	17, 30
$EF_{CH_4,l}$	kg-CH ₄ head ⁻¹ grazing day ⁻¹	Enteric CH ₄ emission factor for livestock type l	Default values from IPCC 2006 AFOLU GL, Table 10.11 (Cattle, N. America, values are annualized)	15, 16, 27, 28
EF_N	MT-N ₂ O-N (MT-N input) ⁻¹	Emission Factor for emission from N inputs	0.0254 (2.54%) of applied synthetic fertilizer N and 0.02 (2%) of applied organic fertilizer N (Davidson, 2009)	12, 23
$EF_{N_2O,l}$	MT-N ₂ O-N (MT-N input) ⁻¹	Emission Factor for emission from manure inputs	Data published in scientific literature. Default values from IPCC 2006 AFOLU GL, Table 11.1.	15, 27
$FC_{p,y}$	d.u.	Proportion of Participant Field p that has been converted to Cropland in the	Project Proponent	10

⁶ https://www.eia.gov/environment/emissions/co2_vol_mass.php

USER'S MANUAL

FOR CARBON OFFSET PROJECTS FROM THE AVOIDED CONVERSION OF GRASSLANDS AND SHRUBLANDS TO CROP PRODUCTION

PARAMETER	UNIT	DESCRIPTION	SOURCE	USED IN EQ.
		baseline scenario for year y , d.u.		
$FC_{p,t,y}$	d.u.	The cumulative proportion of Participant Field p that has been converted to Cropland in year t , time of conversion, as of year y in the baseline scenario, determined based on rates and extents of conversion	Project Proponent	4, 8
$Frac_{ON}$	kg N volatilized (kg of N applied or deposited) ⁻¹	Fraction of organic N applied to soils that volatilizes as NH_3 and NO_x	Default value of 0.20. IPCC 2006 AFOLU GL, Table 11.3.	14, 25
$Frac_{SN}$	kg N volatilized (kg of N applied or deposited) ⁻¹	Fraction of synthetic N applied to soils that volatilizes as NH_3 and NO_x	Default value of 0.10. IPCC 2006 AFOLU GL, Table 11.3.	13, 24
GWP_{CH_4}	MTCO ₂ e	Global warming potential for CH ₄	See ACR Standard	15, 27
GWP_{N_2O}	MTCO ₂ e	Global warming potential for N ₂ O	See ACR Standard	12, 15, 23, 27

USER'S MANUAL

FOR CARBON OFFSET PROJECTS FROM THE AVOIDED CONVERSION OF GRASSLANDS AND SHRUBLANDS TO CROP PRODUCTION

PARAMETER	UNIT	DESCRIPTION	SOURCE	USED IN EQ.
Y_m	d.u.	Methane conversion factor, per cent of gross energy in feed converted to methane	Default values: 6.5% (Cattle or Buffalo grazing); 4.5% (Lambs < 1 year); 6.5% (Mature Sheep). IPCC 2006 AFOLU GL, Tables 10.2 and 10.3.	16, 28
P	d.u.	Total number of participant fields, p	Project Proponent	
t	years	Time since conversion of Grassland to Cropland in the baseline scenario	Project Proponent	
R_b	d.u.	Root carbon-to-shoot carbon ratio of (crop) biomass type b ; default value 4.2 for temperate grassland, 4.5 for cool temperate grassland and 1.8 for shrubland	Data published in scientific literature (grass and crops) including Craine et al. 2005, Mokany et al 2006. Default values from IPCC 2006 AFOLU GL, Table 6.1.	9, 22
$\frac{44}{12}$		Ratio of molar mass of CO ₂ to C	NA	6, 21
$\frac{44}{28}$		Ratio of molar mass of N ₂ O to N	NA	12, 23
$LE_{M,y}$	(0.0 - 1.0)	Market leakage in year y ; (0-1.0)	Default value 0.2 or calculated according to Equation 32. See section 6.3.1.	31, 32

A.3 PARAMETERS MONITORED

PARAMETER	UNIT	DESCRIPTION	SOURCE	USED IN EQ.
B		Total number of crop/bio-mass types b		
$DM_{BL,b,y}$	MT dry matter (ha) ⁻¹	Annualized average dry matter in the baseline for crop type b in year y	Data published in scientific literature. Harvest Index applied to crop yield guides for the Project Region where the Harvest Index is ratio of economic product dry mass to plant aboveground dry mass. Default value of 0.5 MT C (ha) ⁻¹ for annual crops following one year after conversion, Source: IPCC AFOLU GL, Table 5.9.	6
$FSOC_{LU}$	d.u.	Fraction of soil organic carbon pool remaining after transition period, accounting for land use factors	Approved models, direct measurements, data published in scientific literature. Default values from IPCC 2006 AFOLU, GL Table 5.5.	11
$FSOC_{MG}$	d.u.	Fraction of soil organic carbon pool remaining after transition period, accounting for management factors	Approved models, direct measurements, data published in scientific literature. Default values from IPCC 2006 AFOLU, GL Table 5.5.	11
$FSOC_{IN}$	d.u.	Fraction of soil organic carbon pool remaining after	Approved models, direct measurements, data published in scientific literature. Default	11

APPENDIX B: COUNTIES FOR UNIDENTIFIED AGENTS OF CONVERSION

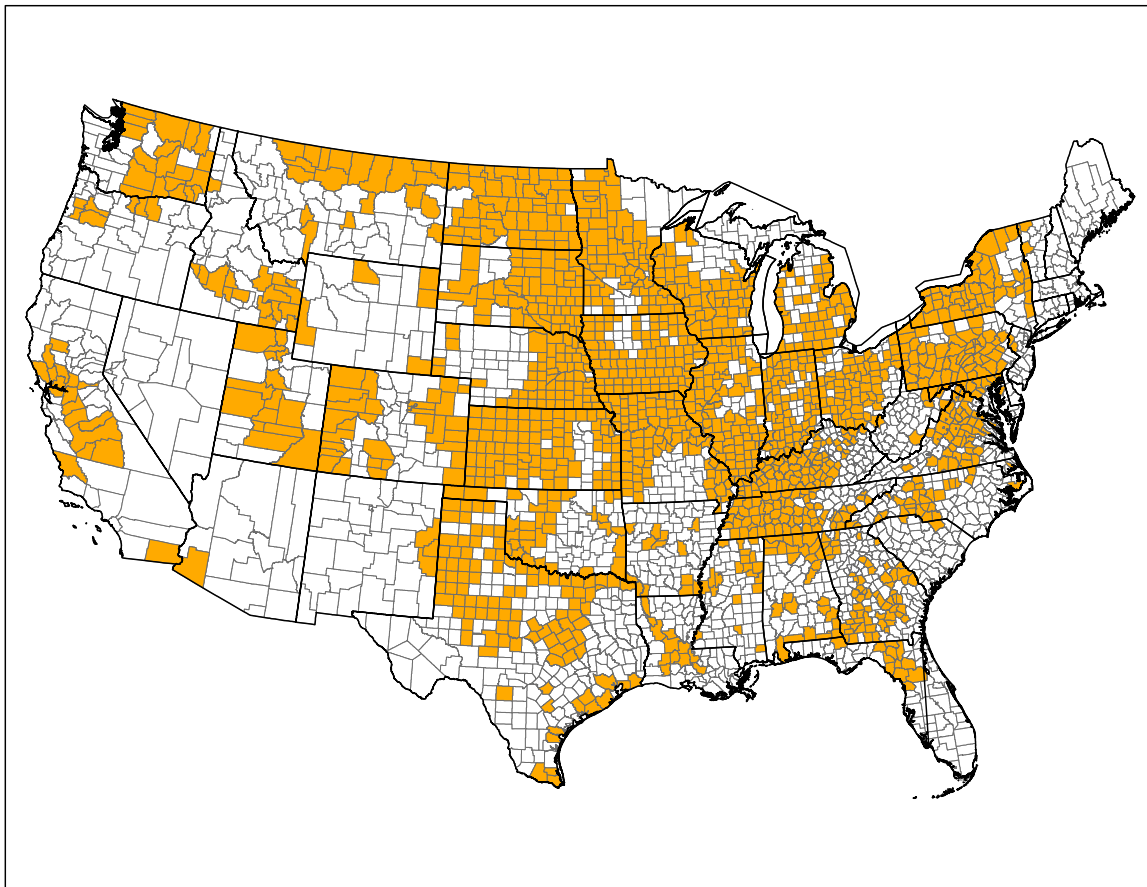

Figure 3: County Map for Unidentified Agents of Conversion

Project fields/parcels located in the counties highlighted in orange have a baseline scenario of cropland for unidentified agents of conversion and surpass the practice-based performance standard for demonstrating additionality. Project fields/parcels in white counties must determine the baseline land-use scenario and demonstrate additionality according to **Sections 3.1.1.2** and **3.2.2.2** of the **Methodology**, respectively.
